GMReis Completes First U.S. Quick Radius™ Case

9/2/2026 / GMReis has completed the first Quick Radius™ Distal Radius System clinical case in the USA, marking the introduction of the company's new single-use procedural platform designed for Ambulatory Surgery Centers (ASCs).

Quick Radius combines sterile implants and dedicated single-use instrumentation in one procedure-specific solution, reducing dependence on conventional reusable trays and simplifying logistics, sterilization, inventory management and OR preparation.

For ASCs, the concept is designed to provide a more standardized and predictable surgical workflow, with the implants and essential instrumentation available together for each procedure.

Quick Radius is the first of several single-use orthopedic procedural systems GMReis plans to introduce in the U.S. market, extending the concept to additional orthopedic procedures.

"Quick Radius represents our strategy of designing not only the implant, but the entire surgical workflow around the needs of ASCs—combining implants, instrumentation and procedural efficiency in one platform."
