

Foundation Surgical Unveils Revolutionary Motion Preservation Procedure with 510(k) Clearance

Scottsdale, AZ – November 8, 2024

Foundation Surgical, an innovative leader in spinal implant technology, is thrilled to announce the US Food & Drug Administration (FDA) 510(k) clearance of its Vertiwedge® Intraosseous Device! This novel, motion-sparing partial vertebral body replacement device along with its Vertebral Body Osteotomy (VBO®) procedure is set to redefine the landscape of lateral and motion-sparing spinal procedures.

The Vertiwedge® is the first intraosseous device designed to facilitate and maintain vertebral body correction of partially collapsed vertebrae via the groundbreaking VBO® procedure. This novel single-position, motion-sparing technique, allows for effective treatment through a conventional lateral or oblique lateral approach and facilitates indirect decompression of the nerve roots while preserving the natural motion of the disc and facet joints without the need for intervertebral fusion.

“With the FDA clearance of the Vertiwedge® and the launch of the VBO® procedure, we are ushering in a new era of spine surgery,” said Dr. Randal Betz, founder and CEO of Foundation Surgical. “Our approach allows for the treatment of degenerative conditions while preserving the spine’s natural motion, a significant step forward in patient care.”

The Vertiwedge® and VBO® stand alongside Foundation Surgical’s earlier innovation, the single-position lateral LLIF180™ procedure, which debuted with the FDA clearance of the Interwedge® Standalone Lateral Interbody Fusion Device. This latest advancement marks another milestone in the company’s commitment to pioneering transformative surgical techniques.

For more information about the Vertiwedge® Intraosseous Device and the motion-sparing VBO® technique, please refer to the Vertiwedge® Indications for Use or reach out to us directly.
